Task 1:

Q1. Daily Agent Productivity

```
CREATE TABLE OnTheGo.agent_daily AS
SELECT agent_id,
    DATE(event_time) AS work_date,
    SUM(status = 'Assigned')  AS assigned,
    SUM(status = 'Delivered') AS delivered,
    SUM(status = 'Hold')      AS holds,
    SUM(status = 'Returned')  AS returned
FROM OnTheGo.order_logs
GROUP BY agent_id, DATE(event_time);
-- First 20 rows for the PDF
SELECT * FROM OnTheGo.agent_daily ORDER BY agent_id, work_date LIMIT 20;
SELECT * FROM OnTheGo.agent_daily
WHERE assigned <> delivered + holds + returned;
-- Full hub summary
SELECT a.hub_id, h.hub_name, h.cluster,
    SUM(d.delivered) AS total_delivered,
    COUNT(*) AS agent_days,
    ROUND(SUM(d.delivered) / COUNT(*), 2) AS avg_deliveries_per_agent_day
FROM OnTheGo.agent_daily d
JOIN OnTheGo.agents a ON a.agent_id = d.agent_id
JOIN OnTheGo.hubs h   ON h.hub_id = a.hub_id
GROUP BY a.hub_id, h.hub_name, h.cluster
ORDER BY a.hub_id;
```

Output:

hub_id	hub_name	cluster	total_delivered	agent_days	avg
H01	Greenfield	Cluster A	3908	144	
H02	Lakeview	Cluster A	3001	149	
H03	Riverside	Cluster B	3479	165	
H04	Hillcrest	Cluster B	3798	123	
H05	Brookside	Cluster C	3411	147	
H06	Westwood	Cluster C	3481	126	

Assumption: an agent-day is a day with at least one Assigned event.

Q2. Hub Utilisation in Week 1 and Week 2

```
-- Definition: utilisation = attempts (Assigned events) / (available agent-days x 40)
-- Target = 85%. Every active agent counts as available every day.
WITH cap AS (
  SELECT hub_id, wk, COUNT(*) AS agent_days
  FROM OnTheGo.agent_day_avail
  GROUP BY hub_id, wk
),
att AS (
  SELECT a.hub_id,
        IF(DATE(l.event_time) <= '2026-10-19', 1, 2) AS wk,
        COUNT(*) AS attempts
  FROM OnTheGo.order_logs l
  JOIN OnTheGo.agents a ON a.agent_id = l.agent_id
  WHERE l.status = 'Assigned'
  GROUP BY a.hub_id, IF(DATE(l.event_time) <= '2026-10-19', 1, 2)
)
SELECT cap.hub_id, cap.wk AS week_no, att.attempts, cap.agent_days,
      ROUND(att.attempts / (cap.agent_days * 40), 3) AS utilisation,
      CASE WHEN cap.wk = 2 AND att.attempts / (cap.agent_days * 40) > 0.85
```

```
        THEN 'ABOVE TARGET' ELSE '' END AS flag
FROM cap
JOIN att ON att.hub_id = cap.hub_id AND att.wk = cap.wk
ORDER BY cap.hub_id, cap.wk;
```

Output:

hub_id	week_no	attempts	agent_days	utilization	flag
H01	1	1925	77	0.625	
H01	2	2482	70	0.886	ABOVE TARGET
H02	1	1647	77	0.535	
H02	2	1730	77	0.562	
H03	1	2281	84	0.679	
H03	2	3051	84	0.908	ABOVE TARGET
H04	1	1943	63	0.771	
H04	2	2416	63	0.959	ABOVE TARGET
H05	1	2023	77	0.657	
H05	2	2202	77	0.715	
H06	1	1870	70	0.668	
H06	2	2025	63	0.804	

Assumption: utilization = attempts ÷ (available agent-days × 40), and every active agent counts as available every day.

Q3. Hold Reasons

```
WITH h AS (
  SELECT o.hub_id, l.hold_reason
  FROM OnTheGo.order_logs l
  JOIN OnTheGo.orders o ON o.order_id = l.order_id
  WHERE l.status = 'Hold'
    AND l.event_time >= '2026-10-20'
    AND l.event_time <  '2026-10-27'
),
tot AS (
  SELECT hub_id,
```

```
        COUNT(*) AS total_holds,
        ROUND(100 * SUM(hold_reason IN ('Late Dispatch','Not Attempted','Agent Time Shortage')) / COUNT(*), 1) AS agent_side_pct
  FROM h
  GROUP BY hub_id
),
rk AS (
  SELECT hub_id, hold_reason, COUNT(*) AS n,
        ROW_NUMBER() OVER (PARTITION BY hub_id ORDER BY COUNT(*) DESC) AS rn
  FROM h
  GROUP BY hub_id, hold_reason
)
SELECT t.hub_id, t.total_holds, t.agent_side_pct,
      MAX(CASE WHEN rk.rn = 1 THEN CONCAT(rk.hold_reason, ' (', rk.n, ')') END) AS top_reason_1,
      MAX(CASE WHEN rk.rn = 2 THEN CONCAT(rk.hold_reason, ' (', rk.n, ')') END) AS top_reason_2
FROM tot t
JOIN rk ON rk.hub_id = t.hub_id
GROUP BY t.hub_id, t.total_holds, t.agent_side_pct
ORDER BY t.hub_id;
```

Output

hub_id	total_holds	agent_side_pct	top_reason_1	top_reason_2
H01	168	19	Customer Unreachable (73)	Customer Rescheduled (35)
H02	123	21.1	Customer Unreachable (50)	Customer Rescheduled (25)
H03	874	64.4	Late Dispatch (312)	Customer Unreachable (156)

H04	182	22	Customer Unreachable (77)	Customer Rescheduled (39)
H05	186	26.3	Customer Unreachable (68)	Customer Rescheduled (43)
H06	146	20.5	Customer Unreachable (66)	Customer Rescheduled (28)

Assumption: agent-side reasons are Late Dispatch, Not Attempted and Agent Time Shortage, and Week 2 is 20–26 Oct.

Q4. What Happens to Held Orders

```
SELECT o.hub_id,
    COUNT(*) AS held_orders,
    ROUND(100 * AVG(o.final_status = 'Delivered'), 1) AS pct_delivered,
    ROUND(100 * AVG(o.final_status = 'Returned'), 1)  AS pct_returned,
    ROUND(100 * AVG(o.final_status NOT IN ('Delivered','Returned')), 1) AS
pct_still_on_hold
FROM OnTheGo.orders o
WHERE o.order_id IN (
  SELECT DISTINCT order_id FROM OnTheGo.order_logs WHERE status = 'Hold'
)
GROUP BY o.hub_id
ORDER BY o.hub_id;
```

Output:

hub_id	held_orders	pct_delivered	pct_returned	pct_still_on_hold
H01	303	88.8	2.6	8.6
H02	228	89.5	4.4	6.1
H03	1184	76.3	13.9	9.8
H04	316	86.1	4.7	9.2
H05	324	80.2	11.4	8.3
H06	244	86.1	4.1	9.8

Assumption: held orders are orders with at least one Hold event.

Q5. High-Return Agents

```
SELECT a.agent_id, a.agent_name, a.hub_id, a.active_status,
    DATEDIFF('2026-10-26', a.joining_date) AS tenure_days,
    SUM(l.status = 'Assigned') AS attempts,
    SUM(l.status = 'Returned') AS returns,
    ROUND(100 * SUM(l.status = 'Returned') / SUM(l.status = 'Assigned'), 1) AS
return_ratio_pct
FROM OnTheGo.agents a
JOIN OnTheGo.order_logs l ON l.agent_id = a.agent_id
GROUP BY a.agent_id, a.agent_name, a.hub_id, a.active_status, a.joining_date
HAVING tenure_days > 30
  AND return_ratio_pct > 15
ORDER BY return_ratio_pct DESC;
```

Output:

agent_id	agent_name	hub_id	active_status	tenure_days	attempts	returns	return_ratio_pct
A1045	Belis Rowntree Coris	H05	Active	463	349	94	26.9
A1046	Halvorsen Wenian	H05	Active	647	414	91	22
A1047	Vantell	H05	Active	526	413	72	17.4

Assumption: return ratio = returned ÷ assigned, with tenure counted to 26 Oct.

Q6. Cost per Delivered Order

```
WITH rates AS (
  SELECT MAX(CASE WHEN what = 'A hold'   THEN amount_bdt END) AS hold_cost,
      MAX(CASE WHEN what = 'A return' THEN amount_bdt END) AS return_cost
  FROM OnTheGo.costs
),
ac AS (
```

```
  SELECT a.hub_id,
        IF(d.work_date <= '2026-10-19', 1, 2) AS wk,
        d.delivered, d.holds, d.returned,
        CASE WHEN a.salary_type = 'Fixed'
            THEN s.monthly_salary / 26
            ELSE s.daily_allowance + s.allowance_per_delivery * d.delivered
        END AS pay
  FROM OnTheGo.agent_daily d
  JOIN OnTheGo.agents a ON a.agent_id = d.agent_id
  JOIN OnTheGo.agent_salary s ON s.salary_type = a.salary_type
)
SELECT ac.hub_id, ac.wk AS week_no,
      ROUND(SUM(ac.pay)) AS agent_pay,
      SUM(ac.holds) * r.hold_cost AS hold_cost,
      SUM(ac.returned) * r.return_cost AS return_cost,
      ROUND(SUM(ac.pay) + SUM(ac.holds)*r.hold_cost + SUM(ac.returned)*r.return_cost) AS
total_cost,
      SUM(ac.delivered) AS delivered_orders,
      ROUND((SUM(ac.pay) + SUM(ac.holds)*r.hold_cost + SUM(ac.returned)*r.return_cost)
          / SUM(ac.delivered), 2) AS cost_per_delivered
FROM ac CROSS JOIN rates r
GROUP BY ac.hub_id, ac.wk, r.hold_cost, r.return_cost
ORDER BY ac.hub_id, ac.wk;
```

Output:

hub_id	week_no	agent_pay	hold_cost	return_cost	total_cost	delivered_orders	cost_per_delivered
H01	1	47658	4770	3740	56168	1698	33.08

H01	2	47944	5040	5720	58704	2210	26.56
H02	1	46728	3630	3135	53493	1469	36.41
H02	2	47588	3690	4125	55403	1532	36.16
H03	1	51038	18810	8580	78428	1498	52.36
H03	2	53482	26220	10780	90482	1981	45.67
H04	1	41896	4830	5225	51951	1687	30.79
H04	2	46076	5460	6765	58301	2111	27.62
H05	1	46086	5130	12155	63371	1631	38.85
H05	2	47896	5580	12980	66456	1780	37.33
H06	1	43592	3720	3245	50557	1687	29.97
H06	2	39512	4380	4675	48567	1794	27.07

Assumption: cost includes agent pay plus BDT 30 per hold and BDT 55 per return.

Q7. Agents Needed for the Forecast

```
WITH w2_orders AS (
  SELECT hub_id, COUNT(*) AS orders_w2
  FROM OnTheGo.orders
  WHERE created_at >= '2026-10-20' AND created_at < '2026-10-27'
  GROUP BY hub_id),
w2_att AS (
  SELECT o.hub_id, COUNT(*) AS attempts_w2
  FROM OnTheGo.order_logs l JOIN OnTheGo.orders o ON o.order_id = l.order_id
  WHERE l.status = 'Assigned'
    AND l.event_time >= '2026-10-20' AND l.event_time < '2026-10-27'
  GROUP BY o.hub_id),
```

```
av AS (
  SELECT hub_id, COUNT(*) AS active_agents
  FROM OnTheGo.agents WHERE active_status = 'Active' GROUP BY hub_id)
SELECT f.hub_id, f.week_start, f.expected_orders,
      ROUND(a.attempts_w2 / o.orders_w2, 3) AS apo,
      ROUND(f.expected_orders * a.attempts_w2 / o.orders_w2) AS required_attempts,
      CEIL(f.expected_orders * a.attempts_w2 / o.orders_w2 / 238) AS required_agents,
      v.active_agents,
      CEIL(f.expected_orders * a.attempts_w2 / o.orders_w2 / 238) - v.active_agents AS
staffing_gap
FROM OnTheGo.volume_forecast f
JOIN w2_orders o ON o.hub_id = f.hub_id
JOIN w2_att a ON a.hub_id = f.hub_id
JOIN av v ON v.hub_id = f.hub_id
ORDER BY f.hub_id, f.week_start;
```

Output:

hub_id	week_start	expected_orders	apo	required_attempts	required_agents	active_agents	staffing_gap
H01	2026-10-27	2470	1.072	2648	12	10	2
H01	2026-11-03	2545	1.072	2729	12	10	2

H06	2026-11-17	1871	1.074	2009	9	9	0

Assumption: Week 2 attempts per order is assumed to continue.

Q8. The Hiring Request

Recommendation: do not approve 8 hires. Approve 2 new Fixed hires (H04), 2 transfers (H02 to H01) and 1 hold reduction programme (H03). The 8 requested hires would cost BDT 175,200 in month 1; this plan costs BDT 62,800.

Assumptions

- Utilisation = Assigned attempts ÷ (available agent-days × 40). Target = 85%.
- Capacity per agent per week at target = 7 × 40 × 0.85 = 238 attempts.

- Required attempts = forecast orders × Week 2 attempts per order (APO). The Week 2 APO is assumed to continue.
- The hold programme removes 50% of agent-side holds, reaching full effect over 14 days on a straight-line ramp: about 29% of full effect in forecast Week 1, 79% in Week 2, then 100%. A removed hold also removes its next-day re-attempt, so APO falls.
- New agents work at 60% speed for their first 7 days. Moved agents work at full speed.
- A Fixed hire costs BDT 21,900 in month 1 (5,000 one-time + 16,900 salary). A move costs BDT 2,000.
- Fixed beats Variable above 25 deliveries a day (300 + 14d = 650). H04 delivers about 33 per agent per day, so we hire Fixed.
- Clusters: A = H01 + H02, B = H03 + H04, C = H05 + H06. Moves stay inside a cluster, and only out of hubs below 75% Week 2 utilisation.

Hub-by-hub evidence

Hub	Cluster	Agents	Wk2 utilisation	Gap, forecast wk 1-4	Agent-side holds	Cost per delivered, Wk1 → Wk2 (BDT)
H01 Greenfield	A	10	88.6%	+2, +2, +2, +2	19%	33.08 → 26.56
H02 Lakeview	A	11	56.2%	-4, -3, -3, -3	21%	36.41 → 36.16
H03 Riverside	B	12	90.8%	+1, +2, +2, +1	64.4%	52.36 → 45.67
H04 Hillcrest	B	9	95.9%	+2, +2, +2, +2	22%	30.79 → 27.62
H05 Brookside	C	11	71.5%	-2, -1, -1, -1	26%	38.85 → 37.33
H06 Westwood	C	9	80.4%	0, 0, 0, 0	20%	29.97 → 27.07

Cost per delivered order includes agent pay plus BDT 30 per hold and BDT 55 per return.

Decision per hub

- **H01: no hire. Move 2 agents from H02 (BDT 4,000).** Utilisation is 88.6% and the gap is 2 in every week, so the need is real. Only 19% of its holds are agent-side, so a hold programme would not help. H02 is in the same cluster and below 75%, so it may donate. After the move, H01 runs at about 79-82% and H02 (9 agents) at about 66-68%.
- **H02: donor.** It needs only 8 agents from Week 2 onwards, so it could give up to 3 and stay near 77%. We move 2 and keep one spare as a buffer.
- **H03: no hire. Run the hold reduction programme (BDT 15,000).** H03 had 874 holds in Week 2 against 123-186 at other hubs. 64.4% (about 563) were agent-side, and Late

Dispatch alone accounts for 312. Its 1.39 attempts per order compare with 1.07-1.10 elsewhere, and its cost per delivered order (BDT 45.67) is the highest in the company. This is a process problem more than a headcount problem. With the programme, attempts per order fall from 1.393 to about 1.26 at full effect, and the gap becomes about 1, 1, 0, 0. A hire would cost BDT 21,900 and work at 60% speed in week 1, so it would not fix the first two weeks.

- **H04: approve 2 Fixed hires (BDT 43,800).** H04 is the most overloaded hub at 95.9%. Its forecast of 2,443-2,542 attempts a week is 97-101% of what 9 agents can do at the standard 40 a day. Only 22% of its holds are agent-side (about 40 a week), so a programme would save almost nothing. It needs capacity, and H03, its only cluster partner, is itself overloaded. After the hires (11 agents), utilisation is about 85% in forecast week 1 while the new agents are at 60% speed, then 80-82% in weeks 2-4.
- **H05: no hire, no move.** Its surplus is real (71.5%), but its cluster partner H06 has no gap, so the surplus stays as a reserve and as backup for H06. Its cost per delivered order is high (BDT 37.33) because of returns (BDT 12,980 in Week 2, the highest of any hub). Coach the high-return agents from Q5 at no cost.
- **H06: no hire.** Utilisation is 80.4% and the gap is 0, but required agents (9) equal headcount (9) after one agent left, so there is no buffer. Monitor weekly.

Q9. The Budget (BDT 70,000)

Spend BDT 62,800 on 2 moves, 1 hold programme and 2 Fixed hires, and keep BDT 7,200 as contingency. This closes the gaps at H01, H03 and H04 for BDT 112,400 less than the 8-hire request.

Action	Hub	Qty	Cost (BDT)
Agent moves from H02	H01	2	4,000
Hold reduction programme	H03	1	15,000
New Fixed agents (5,000 one-time + 16,900 salary)	H04	2	43,800
Total			**62,800**
Left as contingency			**7,200**

The contingency covers up to 3 more moves at 2,000 each. The likeliest uses are one H05 to H06 move if an H06 agent leaves, or one more H02 to H01 move. If salary is charged for all 28 forecast days (28 × 650 = 18,200 per agent), the total is 65,400 and the buffer is 4,600.

Expected Return

Assumptions: average delivery charge is about BDT 65 per delivered order at every hub. Revenue protected is an upper bound, because overloaded agents can work above 40 attempts a day, so not every extra attempt would otherwise be lost. Hold cost is BDT 30 and return cost BDT 55. Week 2 delivery rates are assumed to continue.

Action	Expected return	Payback
2 moves, H02 to H01 (BDT 4,000)	Adds 2 × 238 = 476 attempts a week at target. At H01's 89% delivery rate (2,210 of 2,482 attempts) that is about 424 deliveries, or about BDT 27,600 a week of revenue protected (424 × 65.08). It also avoids 2 hires (BDT 43,800 in month 1), so it is BDT 39,800 cheaper than hiring. H01 falls from 88.6% to about 79-82%.	Under 1 week
H03 hold programme (BDT 15,000)	About 281 fewer holds a week at full effect × BDT 30 = about BDT 8,400 a week, and about 283 attempts a week freed (about 1.2 agents). Month-1 saving with the ramp (29%, 79%, 100%, 100%) is about BDT 26,000. Avoided returns are extra upside, not counted. H03 cost per delivered order falls from BDT 45.67 to about BDT 41.4 (holds only).	About 3 weeks
2 Fixed hires at H04 (BDT 43,800)	Adds 476 attempts a week at target. At H04's 87% delivery rate (2,111 of 2,416) that is about 416 deliveries, or about BDT 27,000 a week (416 × 65.04). Net of pay (about BDT 8,450 a week for two) and hold/return cost (about 2,400) the net is about BDT 16,200 a week at full speed. New agents work at 60% in their first 7 days, so month-1 deliveries are about 1,498, or about BDT 97,400 of revenue protected. After 43,800 of pay and one-time cost and about 8,700 of hold/return cost, the month-1 net is about BDT 44,900.	About 3 weeks counting the ramp

H04 break-even check: one extra delivery costs about BDT 19 in pay (650 ÷ 33.5 deliveries a day) plus about BDT 5.8 in hold and return cost, so about BDT 25 against a BDT 65 charge. Each extra delivery earns about BDT 40.

Total: BDT 62,800 spent against BDT 175,200 for the 8-hire request. Month-1 benefit is roughly BDT 26,000 (H03 savings) plus BDT 97,400 (H04) plus BDT 110,000 or more (H01 moves, 4 weeks × BDT 27,600). The H01 and H04 figures are revenue protected, so quote them as an upper bound.

Q10. The Risks

Six risks could break the plan, and each has a number we can check within 14 days and an action it triggers.

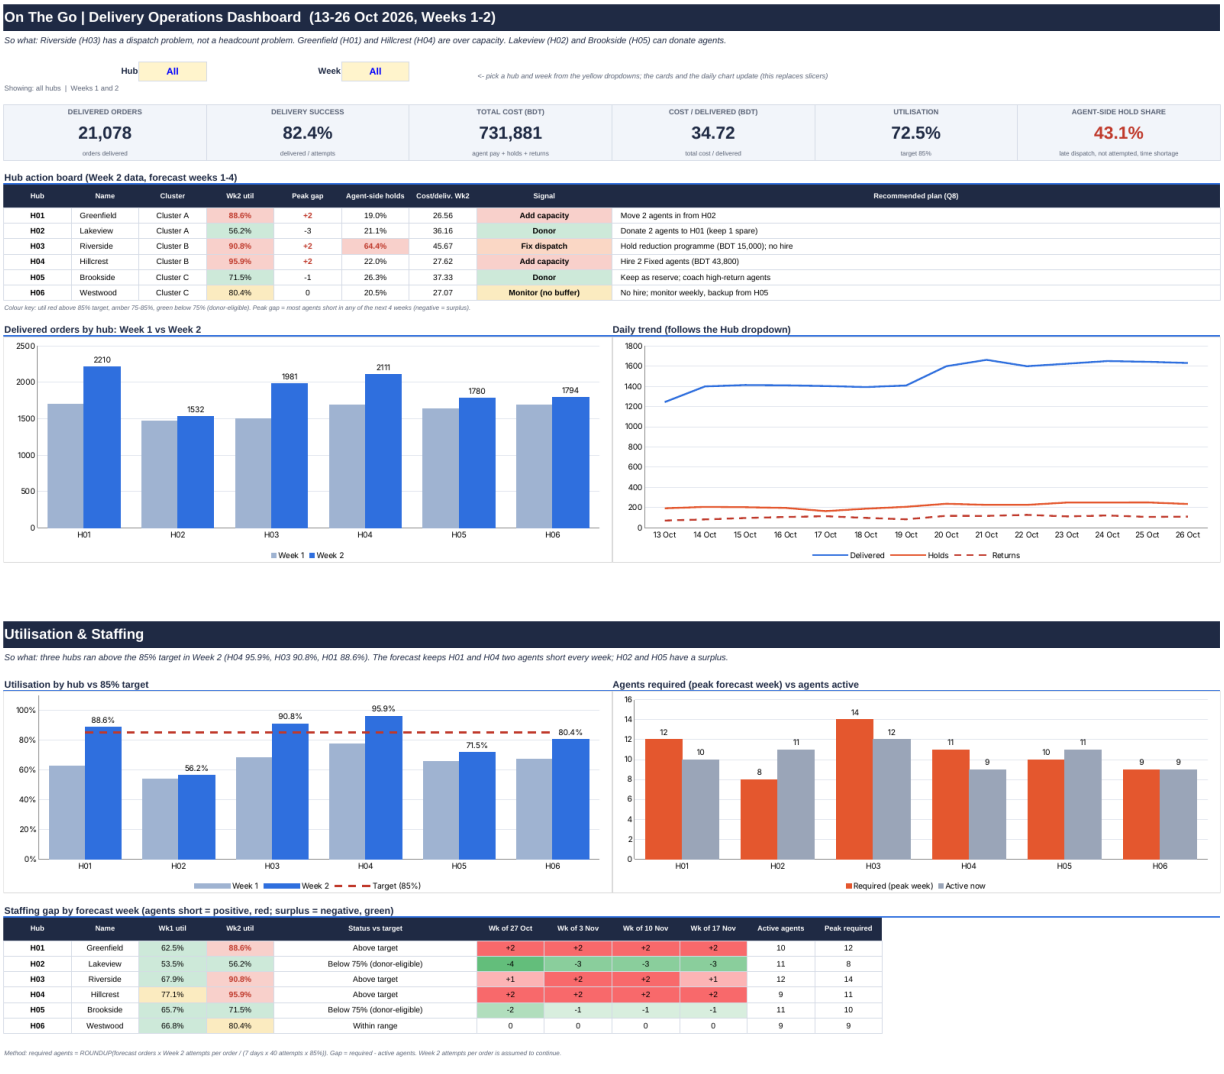

#	Risk	Indicator (check within 14 days)	Threshold	Action
1	Forecast is wrong	Actual vs forecast orders by hub, after week 1	More than ±10%	Re-run Q7 before releasing contingency or hiring. If volume is under forecast, pause the H04 hires.
2	H03 programme under-delivers	Agent-side holds a week (baseline about 563, Late Dispatch 312) and attempts per order (baseline 1.393)	Week 1 above about 480, Week 2 above about 340, or by day 14 a fall of under 25% (above about 420)	Escalate to the dispatch root cause (cut-off times, route loading). Treat H03's gap as a hire case and use the contingency.
3	New agents ramp slowly	Attempts per new agent per day at H04	Below 24 in days 1-7 (60% of 40), or below 30 in days 8-14	Extend the ramp assumption, re-run H04 utilisation, and shift dispatch to the new agents gradually.
4	Moves don't fix H01, or hurt H02	Weekly utilisation at H01 and H02	H01 above 85% for 2 consecutive weeks, or H02 above 80%	H01: use the contingency for another move. H02: stop moving agents.
5	Attrition (Week 1 lost one agent each at H01 and H06)	Agents leaving per week, by hub	Any exit at H01, H04 or H06	Re-run Q7 the same day. H06 needs 9 and has 9, so one exit creates a gap: move one agent from H05 (same cluster, 71.5%, BDT 2,000). For H01, move the last spare H02 agent (BDT 2,000). H04 has no donor, so it needs a hire (BDT 21,900), which the contingency cannot fully cover, so seek approval.
6	Returns and holds raise cost	Return ratio per agent and per hub (H05 return cost was BDT	Agent return ratio above 15%, or hub cost per delivered order	Coach the Q5 agents first, then reassign. Fix customer-side holds with better customer communication.

#	Risk	Indicator (check within 14 days)	Threshold	Action
		12,980 in Week 2)	rising over 2 weeks	

Day-14 decision gate

Continue the plan if H03 agent-side holds are down at least 25%, H01 and H04 utilisation is at or below 85%, and actual volume is within ±10% of forecast. If two or more checks fail, stop further spending and re-plan.

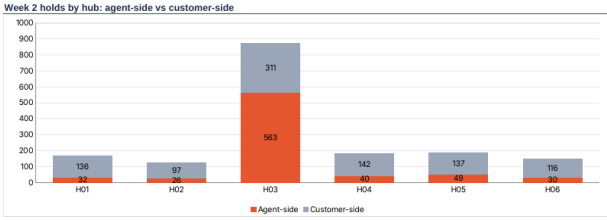

Task 3 - Dashboard Development

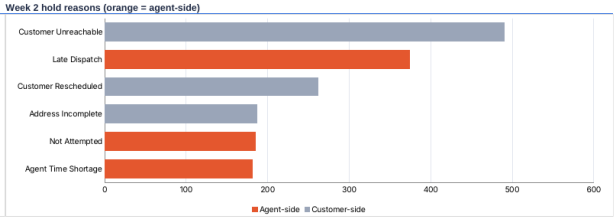

Holds & Returns

So what: Riverside (H03) logged 874 holds in Week 2, about 64% agent-side and led by Late Dispatch. Everywhere else holds are mostly customer-side. Brookside (H05) has the highest return cost.

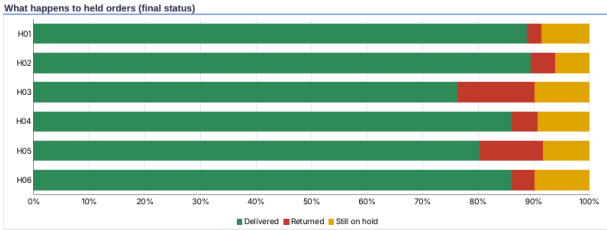

Week 2 holds by hub: agent-side vs customer-side

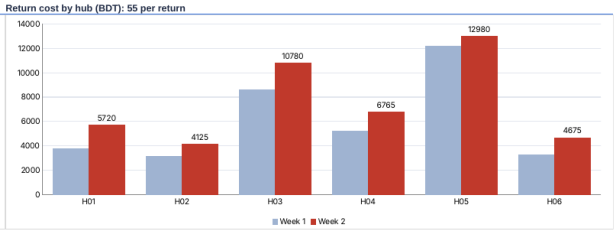

Week 2 hold reasons (orange = agent-side)

What happens to held orders (final status)

Return cost by hub (BDT): 55 per return

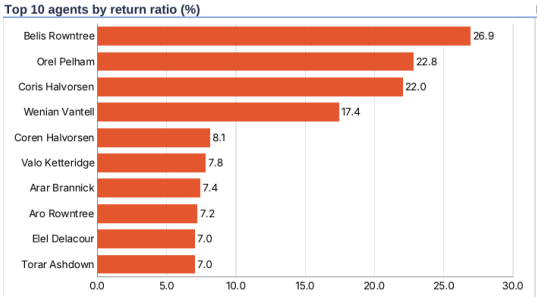

Notes: agent-side = Late Dispatch, Not Attempted, Agent Time Shortage. Held-order chart shows % of orders with at least one hold by their final status (green delivered, red returned, amber still on hold). Costs: BDT 30 per hold, BDT 55 per return.

Agents

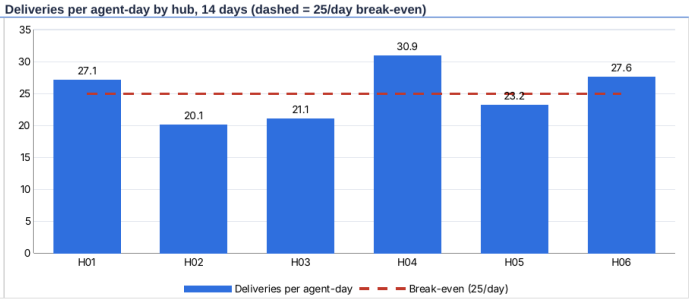

So what: three Brookside (H05) agents with more than 30 days' tenure return over 15% of their attempts. Only H01, H04 and H06 average more than the 25 deliveries a day at which a Fixed agent beats a Variable one.

ACTIVE AGENTS	HIGH-RETURN FLAGGED	RETURN RATIO (ALL)	DELIVERIES / AGENT-DAY
62	**3**	**5.8%**	**24.7**
of 64 on the roster	tenure >30 days, return ratio >15%	returns / attempts, 14 days	all hubs

Top 10 agents by return ratio (%)

Deliveries per agent-day by hub, 14 days (dashed = 25/day break-even)

All agents, sorted by return ratio

Rank	Agent ID	Name	Hub	Type	Status	Tenure (days)	Days worked	Attempts	Delivered	Returns	Return ratio (%)	Deliveries / day	Flag
1	A1045	Belis Rowntree	H05	Variable	Active	463	13	349	231	94	26.9	17.8	HIGH RETURN
2	A1050	Orel Pelham	H05	Fixed	Active	20	13	334	228	76	22.8	17.5	High return (new)
3	A1046	Coris Halvorsen	H05	Fixed	Active	647	14	414	295	91	22.0	21.1	HIGH RETURN
4	A1047	Wenian Vantell	H05	Variable	Active	526	14	413	301	72	17.4	21.5	HIGH RETURN
5	A1023	Coren Halvorsen	H03	Variable	Active	201	14	480	310	39	8.1	22.1
